Wood Screws

Stainless Steel Wood Screws

Use a wood screw when you need more holding power than a nail can provide. Wood screws are threaded at least two-thirds of their length and have a sharp point to facilitate entry. To prevent splitting, we recommend that you drill a starter hole slightly smaller than the screw you're installing. Use a countersink to create a recess for flat and oval head screws.

FNL Stainless Steel Exterior Wood/Deck Screws

These high performance exterior wood screws have a unique thread form that is designed to significantly reduce driving torque compared to a traditional wood screw by almost 20%. Additional reverse spiral threads increase the driving speed as well as prevent splitting in hardwoods.
